Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Rachel Felver

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Herbert Thomson

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Jennifer Kinney

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Tim Deller

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Sara robins

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Paul McGuire

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
John Miskelly

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Zachary Cecil

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Theresa Worrell

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Do we really want to risk our water supply, earthquakes, roads, and a negative impact on tourism so a few people can make money for a short time? I know I don't. Hundreds of wells in Pennsylvania have now been confirmed to be contaminated by Fracking - PLEASE, KEEP MARYLAND A FRACK FREE ZONE!!!

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
re ce

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, you and state officials have said that you will not move forward with fracking until it is proven safe, but the precursor to fracking regulations was finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in our state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Lyn Lowry

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
M J

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Marjorie Gray

Subject: Please no fracking in Maryland -- it is unhealthy and dangerous to our environment

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Negative impacts to public health in Maryland will be significant if the state allows fracking.

- water will become undrinkable
- crops and produce will not be irrigated and our agriculture will fail
- livestock will be harmed
- the economy will undergo tremendous damage
- long-term chronic health damage to people will be irreversible, starting with children who are exposed

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

The report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

The legislation that Maryland will not protect people or land or water or crops or livestock or the resulting damage to the economy.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot AND MUST NOT move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Eric Silberman

This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.
Fracking is not safe for human health!

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Claudia Smith

Subject: Fracking in MD Contemptibly Irresponsible.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Dear Governor,

While states as gung-ho about dinosaur fuels as Texas are re-examining the wisdom of fracking, does it make any sense for a state like Maryland to consider starting its use?

Maryland and the Chesapeake Bay are intertwined. Look after the one to look after the other. Allowing contamination of water should be anathema to any governor of Maryland and it does not bode well for an ex-governor's future to leave a legacy where such a prime responsibility is shirked.

While you remain our governor, Mr. O'Malley, I expect you to look two and three times at proposals that risk Maryland's watershed health. Fracking is failing the first glance. This should not even be worthy of your consideration. It is time to decisively reject fracking in Maryland demonstrating your potential for leadership.

Thank you,

--Bill Jacobs
MCDCC Chair 08-10 - 2008-2014
Montgomery Green Democrats

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Bill Jacobs

When the companies that are doing fracking will not, or cannot tell us what chemicals they are pumping into the Earth as part of their process, then I say it is incumbent upon you and all government officials to say "NO, you may not frack in our state". I believe that they don't want us to know what chemicals they are using so that when health issues and water pollution issues occur in the future, they won't be able to be traced back to the fracking companies. Please don't allow fracking to become the asbestos of the future.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

I have written to you numerous times on this issue. Now your very own report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. Why go this route, then? Methane is a fossil fuel too, and the way it is extracted and leaked releases as many greenhouse gases as coal. We should be putting ALL our investment into clean, renewable energy. The sun alone could supply all our needs.

As to fracking, in trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Laura Tilley

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

I have written to you numerous times on this issue. Now your very own report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. Why go this route, then? Methane is a fossil fuel too, and the way it is extracted and leaked releases as many greenhouse gases as coal. We should be putting ALL our investment into clean, renewable energy. The sun alone could supply all our needs.

As to fracking, in trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Subject: NO MORE FRACKING

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Last year new scientific peer reviewed studies were released showing the "natural" gas ADDS MORE greenhouse gases to our atmosphere than does coal, not less. I can send you the papers if you can't find them. I've sent them to Senator Cardin who is also unfortunately supporting the Cove Point project. Why aren't you reading all of the articles and stories about real people in this country having their daily water supplies and health wrecked by chemical pollutants from fracking? When will you and our federal reps say enough is enough? When will you realize that money and campaign contributions aren't worth risking Marylanders health and precious water? When will you accept the world scientific consensus that is now saying we MUST leave 75% of all fossil fuels in the ground if we want the next generations to have a chance at survival? Stop being a politician and start being a LEADER!

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Catherine Bye

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Phyllis Duren

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Michele Hayes

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

You and I have met over the years when you lived in Arcadia. I'm friends with Chris Muldowney and Dawna McGlynn and a Lauraville resident. So I hope I'm not just a faceless stranger although a voter. I would really not want to see fracking in Maryland. It has been a disaster everywhere it's been done. Why should we allow another environmental disaster when we know it ahead of time? Please do not allow this awful threat to people's health and our beautiful state.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Jeanne Sears

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

We have found now what a precious resource water is - and millions of gallons of it are used in the fracking process. Analysis by USGS has found that the water Marylanders use in western MD is millions of years old - you can't replace that anytime soon.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Helene Lisy

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Gayle B. Rosenberry

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Cynthia Arnold

This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

It's important to note that there is new research from Colorado and Pennsylvania, where fracking is ongoing, showing increased rates of low birth weight babies and babies being born with birth defects. This research is looking at babies born to moms living within 1 mile of a gas well.

This is too serious to ignore, and I hope you won't.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Karla Fortunato

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

Our LIVES and HEALTH are at stake.

THANK YOU for helping to save us and our environment.....

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Elizabeth Koopman

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Ana Rubio

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

Allowing fracking in Maryland is something we would live to regret. It would behoove us to never allow it to begin--never even "let the camel's nose under the tent." Down the road the nation will admire us for staying strong and not allowing fracking into our state. I would be very proud to live in a state that decides NO!

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,

Catherine Pringle

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Perry Moutsos

In addition, escaping methane that the nat. gas industry will not and cannot control is far more potent a greenhouse gas than CO₂. The Chesapeake Bay is already sinking and at great risk from sea-level rise. After Superstorm Sandy, NY and NJ were almost denied federal aid by Congressmen from red states that get plenty of hurricane, tornado, drought, and flood aid from the USG.

For the coming day that Maryland crawls begging for federal storm-disaster relief, Maryland better have clean hands. Maryland needs to show self-responsibility before asking for the inevitable federal bail-out. That means no fracking.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Keith Eagle

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
linda just

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Sasan Dehghan

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Randall Davis

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Yerodin Anthony

This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Isa Kendall

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Isa Kendall

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Donna Rice

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Chris Schmitthenner

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Shannon Marshall

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Stanley Bowser

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Dixie Mullineaux

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Marilynn Baldwin

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Barbara Miller

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Paula Beall

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Lisa Hopkins

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Harry Sklaroff

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
mark benson

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Lawrence Dunston

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
India Eichelberger

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. There is no such thing as "the best management practice" when it comes to fracking and I can't even believe you would even consider risking the health of Marylanders along with destroying our environment. Don't act like a Republican governor would do. If I wanted a Republican governor for our state, I would have voted for one. I suggest you listen to us--the people.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Irma Sheon

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Karen Whitham

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

The oil industry has demonstrated that it is an untrustworthy, amoral industry, with a vast history of polluting, dishonesty, greed, corrupting government agencies and a disregard for the environment and ecosystems. Given the oil industry's past behavior, why should we trust them now?

Indeed, the oil industry will not even disclose the chemicals used during fracking. In case of a mishap, how can emergency first responders appropriately do their jobs without this vital information? And, how can we properly assess the short and long term ramifications to our environment and planet?.

We need to move away from fossil fuels and invest our commitment and resources in green energy. Alternative energy sources such as solar, wind and battery will not only create jobs, but not pollute our planet and our bodies.

Again, I urge you to protect our precious planet, environment and ecosystems; and not participate in the continued compromise and harm to these vital resources.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Carsell Fox Sr

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Once water has been used in the fracking process with unnamed and probably dangerous and toxic chemicals, it is no longer potable, nor can it be used for agricultural purposes. Cleaning up such polluted water is much more costly would likely entail further pollution as well. Without clean, safe water, people cannot survive. This water must be protected from fracking so that future generations can exist. The long-term harm of pollution of our water is too dangerous to allow.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is

inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Nancy Chang

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Br John Mahoney

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Once water has been used in the fracking process with unnamed and probably dangerous and toxic chemicals, it is no longer potable, nor can it be used for agricultural purposes. Cleaning up such polluted water is much more costly and would likely entail further pollution as well. Without clean, safe water, people cannot survive. This water must be protected from fracking so that future generations can exist. The long-term harm of pollution of our water is too dangerous to allow.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Elizabeth Kehne

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found the risk of negative impacts to public health in Maryland is significant if the state allows fracking. In quantifying the dangers of fracking to public health, researchers found that water contamination, air pollution, and other fracking related problems, like increased truck traffic and crime rates, present high risks of causing health problems that can be irreversible or even fatal.

The report also stresses multiple times that these negative health impacts will be disproportionately experienced by vulnerable groups such as children, the elderly, people with existing health problems, and the poor.

The most alarming of all the findings is that researchers find that the fracking rules Maryland is considering will NOT diminish many of these public health impacts, and that significant limitations exist in the health field about how to address the human impacts of fracking.

During this year, Governor O'Malley and state officials have repeatedly said that they would not move forward with fracking UNTIL it is PROVEN SAFE (although the precursor to fracking regulations were finalized a month ago without such proof). It is now PROVEN to be UNSAFE to the public. This new public health report makes it clear that Maryland CANNOT SAFELY move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Sue Bannister

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Kay and Harvey Scherr

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Please put the people first - especially our children, elders and disenfranchised residents! Since, the report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking, just don't allow it. Our residents shouldn't be exposed to the health and environmental problems the researchers found: water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates); particularly since they found that fracking presents high or moderately high risks of causing health problems that could be irreversible or even fatal!

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Carol Wahler

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Marilyn Mazuzan

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
La'Chia Harrison

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Alan Oresky

Over the last year, YOU and other state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Lane Hart, IV

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Dear Governor O'Malley

I am a resident of Garrett County MD which is one of the MD counties that would be affected by fracking and I urge you to use the various studies and the information demonstrating the dangers of the type of energy extraction to local residents like myself. I have a deep water well and even though I own my mineral rights my water source can and would be affected by fracking on large sections of properties near my land. The impact on fresh water and the disposal of waste water from fracking are serious issues that need to be addressed and protect Maryland citizens like myself from the dangers of fracking. I also urge you to help protect our local roads that will be destroyed from the 24/7 traffic that occurs at fracking areas. The impact on tourism in this county could be significant and we cannot risk the negative impact of this type of energy extraction. Please prevent the industry from strong arming the state to allow fracking and continue to review the scientific data for at least five years from existing states to determine the risk of fracking and make the right decision to protect residents of our great state.

Thank you for your considerations:

Scott Richardson 10574 Oakland Sang Run Rd McHenry MD 21541

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Molly Wilson

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

I understand there are negative impacts to public health from tracking, as reported and explored by Food and Water Watch.

I cannot believe that "my" Governor would allow unhealthful practices to please the tracking industry. Please report to the people the least and worst things that might occur, and your opinion on whether they justify allowing tracking in the state.

Food and Water Watch says, "Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago."

This is not good government.

Sincerely,
Sally

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

LINE THE POCKETS OF THE RICH.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health d and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Anne Marie Martinez

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Hopefully, you and Brown will do What is BEST FOR MARYLAND....AND NOT
LINE THE POCKETS OF THE RICH.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health d and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
J M

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Kathleen Bartolomeo

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Phil Pfanschmidt

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Edwin Brown

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Colleen Humphries

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
William Strong

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Leigh Sands

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Raymond Holt

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Putting the health of humans, animals and the environment at risk is poor compensation to giving in to the pressure of those who will benefit from fracking. What is the rush? This fuel has been here for eons and will still be here after competent, honest, uninvolved with the oil industry scientists, review everything involved in fracking and make a unified and intelligent decision on its harm or safety, whatever the conclusion. Nothing should be rushed through just to satisfy a few greedy persons.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is

inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Diane Andrulonis

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Art Wagner

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Joseph Michael

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Joseph Michael

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

In addition to human health concerns, which should by themselves be a sufficient deterrent to fracking in Maryland, the potential also exists, and has not been thoroughly evaluated, for severe damage to our ground water supply, and by extension, to the Chesapeake Bay. Marylanders in nine jurisdictions are already paying substantially higher water bills to help clean up the Bay, but allowing fracking in the state is likely to pollute an already fragile ecosystem to the point of no return, thus costing the state more in lost revenues from tourism, fishing, and other industries than it would gain by allowing fracking. State delegates have not been responsive to constituents' concerns regarding fracking, so now it falls on your shoulders to protect the most vulnerable Marylanders from the very real dangers if fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a

month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

Greetings,

I am not an expert, but based on the recent University of Maryland study on "frack", it appears that this technic presents high risks to health and can triggering irreversible settings or even fatal conditions.

I encourage the Maryland State administration to take available and adequate safeguards steps to make drilling for natural gas (hydraulic fracturing) not a danger prone to harm the health of residents, workers and communities in Western Maryland.

Your administration must take safe measures and be declared valid by a commit of scientist from Maryland University. The "frack" approach in Maryland must be declared as low risk or insignificant.

Sincerely.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Do not cave in to corporate pressure at the expense of our health and future.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Brad Knopf

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Mary Luddy

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Linda Immler

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
anette stauske

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Jane Mather

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Chris Tennant

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Dagmar Fabian

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Bonnie Sudnick

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Raymond Arent

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Hilde Depauw

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Sue Hustead

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
David Lavine

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Shandra Bell

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Morris Turner

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Nancy Zbel

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Jeffrey LaRocque

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

We are learning more all the time about the true effects of fracking on both the natural environment and on our own personal health. We cannot just turn a blind eye to these truths. The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

In many instances, the negative impact of fracking is explained and further clarified that it will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

We absolutely must take the time to thoroughly study fracking and its effects before proceeding. The most concerning aspect of this report is that the researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Governor O'Malley, you and other state officials have said that you will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

In many instances, the negative impact of fracking is explained and further clarified that it will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

We absolutely must take the time to thoroughly study fracking and its effects before proceeding. The most concerning aspect of this report is that the researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Governor O'Malley, you and other state officials have said that you will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Christine Kelsey

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Dennis Cloutier

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Linda Cunningham

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Pamela Hughes

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
bonnie bick

I am very disturbed that compressing of liquid natural gas for export out of the Chesapeake Bay is moving forward. It is dangerous for the health of all Marylanders and it only postpones an inevitable reality of learning to live on less in the way of carbon based fuels and the development/promotion of alternative forms of energy in addition to energy conservation measures.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Subject: Study Proves Public Health Risks Too High to Frack in MD

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Diane Bennett

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

The report stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems, and the poor. Allegany and Garrett County, where fracking would be initiated in the state, are already disproportionately poor and unhealthy.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations, the final draft Best Practices, were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Natalie Atherton

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Paul Bowman

Subject: Study Proves Public Health Risks Too High to Frack in MD !!!!!

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking!!

In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal. Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

But perhaps the most problematic of all the findings is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking!!

Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

PLEASE DO THE RIGHT THING FOR THE HEALTH OF THE CITIZENS OF MARYLAND AND STOP FRACKING! You claim to be pro-environment -- well PROVE it!

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Nikki Wojtalik

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
David Gonzalez

Subject: The Public Health Risks Are Far Too High to Frack in MD!

Dear Governor O'Malley,

I urge you to protect Marylanders from the health threats associated with fracking by altogether prohibiting it in the state. The governor's fracking advisory commission just issued an eye-opening report about the public health dangers that would be associated with fracking in Maryland.

The report found that the risk of negative impacts to public health in Maryland will be significant if the state allows fracking. In trying to quantify the dangers to public health that fracking would have, researchers found that water contamination, air pollution and other problems related with fracking (like increased truck traffic and crime rates) present high or moderately high risks of causing health problems that could be irreversible or even fatal.

Multiple times, the report also stresses that these negative health impacts will be disproportionately felt by vulnerable groups such as children, the elderly, people with current health problems and the poor.

Perhaps the most problematic of all the findings, however, is that researchers don't believe that the fracking rules that Maryland is considering will diminish many of these public health impacts and that significant limitations still exist in the health field about how to properly address the impacts of fracking.

Over the last year, Governor O'Malley and state officials have said that they will not move forward with fracking until it is proven safe, even though the precursor to fracking regulations were finalized a month ago. This new public health report is a clear indication that Maryland cannot move forward with fracking in the state.

I urge you to protect your Maryland constituents by fully discrediting the current process to allow fracking in Maryland and to move to prohibit drilling in the state altogether. As this report shows, fracking is inherently unsafe and no regulations can fully protect Marylanders.

Sincerely,
Sarah Peters
