Maryland Weekly Influenza Surveillance Activity Report
A summary of influenza surveillance indicators reported to MDH for the week ending January 26, 2019

Prepared by the Division of Infectious Disease Surveillance
Prevention and Health Promotion Administration
Maryland Department of Health

The data presented in this document are provisional and subject to change as additional reports are received.

SUMMARY
During the week ending January 26, 2019 influenza-like illness (ILI) intensity in Maryland was HIGH and there was WIDESPREAD geographic activity. The proportion of outpatient visits for ILI reported by Sentinel Providers and by Maryland Emergency Departments both increased. The proportion of MRITS respondents reporting ILI remained similar to last week. Clinical laboratories reported an increase in the proportion of specimens testing positive for influenza. One hundred and three specimens tested positive for influenza at the MDH lab. There were 55 influenza-associated hospitalizations. There were nine respiratory outbreaks reported to MDH.

ILI Data

ILINet Sentinel Providers
Twenty-two providers reported a total of 5,964 visits this week. Of those, 271 (4.5%) were visits for ILI. This is above the Maryland baseline of 2.0%.

Visits to Emergency Departments for ILI
Emergency Departments in Maryland reported a total of 56,075 visits this week through the ESSENCE surveillance system. Of those, 2,170 (3.9%) were visits for ILI.

Neighboring states’ influenza information:
District of Columbia: [http://doh.dc.gov/service/influenza](http://doh.dc.gov/service/influenza)
West Virginia: [http://dohhr.wv.gov/ceps/disease/Flu/Pages/FluSurveillance.aspx](http://dohhr.wv.gov/ceps/disease/Flu/Pages/FluSurveillance.aspx)
Community-based Influenza Surveillance (MRITS)

MRITS is the Maryland Resident Influenza Tracking System, a weekly survey for influenza-like illness (ILI). A total of 524 residents responded to the MRITS survey this week. Of those, 8 (1.5%) reported having ILI and missing 24 cumulative days of regular daily activities.

Clinical Laboratory Influenza Testing

There were 70 clinical laboratories reporting 4,786 influenza diagnostic tests, mostly rapid influenza diagnostic tests (RIDTs). Of those, 945 (19.7%) were positive for influenza. Of those testing positive, 833 (88%) were influenza Type A and 112 (12%) were influenza Type B. The reliability of RIDTs depends largely on the conditions under which they are used. False-positive (and true-negative) results are more likely to occur when the disease prevalence in the community is low, which is generally at the beginning and end of the influenza season and during the summer.

State Laboratories Administration Influenza Testing

The MDH Laboratories Administration performed a total of 176 PCR tests for influenza and 103 (58.5%) were positive for influenza. Of those testing positive, 74 (72%) were positive for Type A (H1), 16 (16%) were positive for Type A (H3), and 13 (13%) were positive for Type B (Victoria). PCR testing is more reliable than RIDT. The MDH testing identifies subtypes of influenza A and lineages of influenza B, information that is not available from the RIDT results. The table below summarizes results by type, subtype, and lineage.
Influenza-associated Hospitalizations
A total of 55 influenza-associated hospitalizations were reported this week. (A person with an overnight hospital stay along with a positive influenza test of any kind, e.g., RIDT or PCR, is considered an “influenza-associated hospitalization” for purposes of influenza surveillance.) This surveillance is conducted as a component of the Maryland Emerging Infections Program.

Influenza-associated Deaths
An influenza-associated death is one with a clinically compatible illness and a positive influenza test of any kind.

**Pediatric Deaths:** No pediatric (< 18 years of age) deaths were reported this week. Influenza-associated pediatric mortality is a reportable condition in Maryland. Pediatric deaths are tracked without regard to hospitalization.

**Adult Deaths Among Hospitalized Patients:** A cumulative season total of 10 deaths have been reported among adults admitted to Maryland hospitals. Influenza-associated adult mortality is not a reportable condition in Maryland. However, surveillance for mortality in hospitalized adults is conducted as a component of the Maryland Emerging Infections Program.

**Outbreaks of Respiratory Disease**
There were nine respiratory outbreaks reported to MDH this week. (Disease outbreaks of any kind are reportable in Maryland. Respiratory outbreaks may be reclassified once a causative agent is detected, e.g., from ILI to influenza.)
National Influenza Surveillance (CDC)
Influenza activity increased in the United States. Influenza A(H1N1)pdm09, influenza A(H3N2), and influenza B viruses continue to co-circulate.

- **Viral Surveillance:** The percentage of respiratory specimens testing positive for influenza viruses in clinical laboratories increased. Influenza A viruses have predominated in the United States since the beginning of October. Influenza A(H1N1)pdm09 viruses have predominated in most areas of the country, however influenza A(H3) viruses have predominated in the southeastern United States (HHS Region 4).
- **Influenza-like Illness Surveillance:** The proportion of outpatient visits for influenza-like illness (ILI) increased to 3.8%, which is above the national baseline of 2.2%. All 10 regions reported ILI at or above their region-specific baseline level.
- **Geographic Spread of Influenza:** The geographic spread of influenza in 45 states was reported as widespread; Puerto Rico and three states reported regional activity; two states reported local activity; the District of Columbia and the U.S. Virgin Islands reported sporadic activity; and Guam did not report.
- **Influenza-associated Hospitalizations:** A cumulative rate of 15.3 laboratory-confirmed influenza-associated hospitalizations per 100,000 population was reported. The highest hospitalization rate is among adults 65 years and older (39.8 hospitalizations per 100,000 population).
- **Pneumonia and Influenza Mortality:** The proportion of deaths attributed to pneumonia and influenza (P&I) was at the system-specific epidemic threshold in the National Center for Health Statistics (NCHS) Mortality Surveillance System.
- **Influenza-associated Pediatric Deaths:** Two influenza-associated pediatric deaths were reported to CDC during week 4.
- **Outpatient Illness Surveillance:** Nationwide during week 4, 3.8% of patient visits reported through the U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet) were due to influenza-like illness (ILI). This percentage is above the national baseline of 2.2%. (ILI is defined as fever (temperature of 100°F [37.8°C] or greater) and cough and/or sore throat.)
